Description

The air-hydraulic scissor axle-free lift jack is the ideal complement to ATH drive-on scissor lifts and ATH four-post lifts. With its specially adapted chassis, the free-lift jack travels precisely along the running rails of the main lift, creating optimal ergonomic conditions for work on axles, wheel suspensions and brake systems.

A powerful air-hydraulic unit ensures powerful and controlled lifting of the vehicle axle. For proper and safe installation, the system is already fully equipped with a suitable pneumatic line as well as a guide cable for direct attachment to the lift.

The scope of delivery includes two 80 mm plug-in extension pieces as well as two 155 mm plug-in extension pieces. These enable flexible adaptation to different vehicle geometries and the safe compensation of varying support points. A partial double powder coating permanently protects the construction against corrosion as well as mechanical stress in tough daily workshop use. The interplay of precise manufacturing and well-thought-out functionality makes the axle-free lift jack a durable and dependable component for professional vehicle diagnostics and repair.

Additional Information

Rated load capacity	2500 kg
Lifting height max.	570 mm
