Description

The hydraulic wheel lift, with a load capacity of 500 kg, offers a specialised and efficient solution for professional tyre service on commercial vehicles, buses and smaller special-purpose vehicles. The well-thought-out design significantly supports the user in handling heavy wheel-and-tyre combinations and reduces physical strain in daily workshop use to a minimum.

The lifting operation is controlled via a foot-operated hydraulic pump. By dispensing with electrical components, the unit is completely independent of power sources, extremely low-maintenance and can be used with complete flexibility at any workstation. The hands remain free during the pumping process, allowing optimal guidance and securing of the wheel.

An essential feature for precise mounting is the lifting arms equipped with high-quality roller bearings. These allow the raised wheel to be turned easily and smoothly directly on the lift. This considerably eases the alignment of bolt patterns between the rim and the wheel hub, prevents damage to studs or threads and noticeably shortens mounting times. The robust material construction and stable base ensure maximum stability and a long service life under daily strain.
