Description

The hydraulic wheel lift, with a load capacity of 1,500 kg, offers a specialised solution for professional tyre and wheel service on commercial vehicles, buses and heavy machinery. Its design for high loads enables the safe lifting, transporting and mounting of extremely heavy wheel components without significant physical effort.

The unit operates via a hand-operated hydraulic pump and requires no electrical components whatsoever. This makes the wheel lift flexible to use, low-maintenance and independent of external power sources or electrical connections. An integrated control switch allows straightforward and precise opening and closing of the support jaws to adapt to different wheel diameters.

For exact alignment of the wheel with the wheel hub, the lift features a specially positioned handle that allows the raised wheel to be rotated directly on the mounting device. This considerably eases the alignment of bolt patterns, reduces mounting times and protects wheel studs and threads from damage during positioning. The solid construction is designed for tough daily workshop use and offers maximum stability throughout the entire mounting process.
