

Steel mounting head for external spokes (adapter Ø 28.25mm)

Product Images

Description

Wheels with an external spoke design place particular demands on the tool used during tyre mounting. Standard mounting heads often reach their limits here due to their design and carry an increased risk of material and paint damage to the rim contour. This special steel mounting head was constructed exactly for this application to ensure professional and absolutely damage-free demounting and mounting.

The central feature lies in the specially angled and recessed geometry of the head. It creates the necessary clearance in the working area, so that even far-outward-running spoke structures remain contact-free throughout the entire mounting process. Manufacture from high-strength, torsion-resistant steel guarantees exact guiding of the tyre bead as well as a long service life under continuous workshop strain.

Equipped with a standardised mounting bore of 28.25 mm, the steel mounting head integrates seamlessly into existing systems and can be quickly fitted to compatible tyre changers. The tool offers a technically mature solution for workshops that want to offer their customers uncompromisingly safe tyre service even with complex spoke rims.
