

Bead depressor clamp

Product Images

Description

The rotating bead hold-down offers a professional solution for precisely pressing down stiff tyre beads during the mounting process. The special tool reliably holds the tyre bead beneath the rim flange and considerably facilitates the mounting and demounting of modern tyre constructions. The controlled use avoids excessive material stretching, which effectively prevents damage to the tyre sidewall and the bead area.

The use of this tool makes manual pressing down of the bead or the involvement of a second person unnecessary, making workshop work processes considerably more economical. The tool is designed for an optimal fit with the ATH M74, ATH M72, ATH M52 and ATH M32 tyre changers. Due to its universal design, the bead hold-down is also suitable for cross-manufacturer use on other tyre changers.
