

Rim flange protector

Product Images

Description

Made from extremely hard-wearing, flexible special-grade plastic, the rim flange protector provides reliable protection for the sensitive rim edge throughout the entire fitting process. Used specifically as a protective support for the tyre lever, it effectively absorbs point loads during the levering process, consistently preventing scratches, dents and paint defects on high-quality light-alloy wheels. In addition, its carefully engineered geometry ensures a critical protective function for the tyre bead at the traction point, which is of essential importance particularly when handling demanding UHP and run-flat tyres. This rim flange protector is an indispensable tool for professional tyre service, combining the highest material quality with practical usability and sustainably minimising the damage rate in everyday workshop use.
