

Universal wheel lifter for tyre changers

Product Images

Description

The universal wheel lift offers a professional solution for the ergonomic design of workstations in the tyre service workshop. The construction enables independent mounting and alignment regardless of the respective tyre changer. This allows the positioning to be adjusted precisely to the individual requirements of the operator and the local conditions.

With a maximum load capacity of 70 kg, the system effortlessly lifts even heavy passenger-car and SUV wheels to the working height of the clamping unit. The variable adjustment options for the lifting height ensure compatibility with numerous tyre changers of different makes. An integrated pressure unit allows the lifting speed to be precisely adapted to the workshop's own compressed-air network, ensuring controlled and safe handling of the wheels. The maintenance-friendly device design minimises downtime and supports permanently reliable use in everyday workshop operation.
