## Description

---

When mounting tyres on heavy-duty vehicles, buses and campers, high-quality aluminium rims place special demands on clamping technology. The aluminium clamping jaws, specially developed for the ATH 7260 truck tyre changer, ensure reliable, form-fit fixation of the rim without leaving notches or surface damage on the sensitive clamping areas.

Through the precisely matched geometry and material-appropriate contact surface, the required clamping force is distributed evenly. This effectively prevents the wheel from slipping under high torque and reliably protects the rim flange and adjacent paintwork from mechanical stress. The targeted use of these clamping components optimises workflows in tyre service, secures the highest quality standards for the end customer, and ensures a high level of occupational safety when handling heavy commercial vehicle wheels. The robust material design is engineered for continuous load and guarantees a long service life in professional workshop operation.
