

Universal flange PLUS M72Z/M74Z

Product Images

Description

The universal flange for reverse tyre mounting has been specially developed for the requirements of processing special and design rims whose design requires mounting via the back of the rim. In this procedure, the wheel is placed face-down onto the centring plate. To reliably prevent costly surface damage, scratches or deformation to the spokes and rim bed, this special flange guarantees secure and precise fixation.

The specially shaped arms for reverse mounting included in the scope of delivery engage precisely with the wheel's bolt holes. This ensures even force distribution during the clamping process as well as during the actual mounting and demounting process. The robust construction meets the highest demands on mechanical load-bearing capacity in daily workshop use and ensures a high degree of repeatability.

The use of this accessory considerably expands the range of applications of the tyre changer. Workshops are thus able to professionally process even demanding customer wheels according to manufacturer specifications, without compromising on occupational safety or protection of the customer's material.
