Description

Efficient System Upgrade for Pneumatic Wheel Balancers

The SpeedPlate Adapter for P-versions optimises the workflow on wheel balancers with pneumatic clamping. As a precision-manufactured clamping sleeve, it serves as a direct interface for integrating the innovative SpeedPlate clamping plate onto the machine models W44P and W64P in no time at all. This upgrade enables workshops to seamlessly leverage the benefits of advanced PCD centring on their existing pneumatic systems.

Process Reliability Through a Play-Free Connection

In professional tyre service, the precision of the clamping determines the quality of the balancing result. The clamping sleeve guarantees an absolutely play-free and friction-locked connection between the pneumatic main shaft and the centring tool.

- Maximum repeatability: Prevents tolerances during clamping and ensures error-free measurement results on the first measuring run.
- Faster throughput: Noticeably speeds up the clamping process and increases efficiency in daily workshop operations.

Robust Construction for Continuous Use

Designed for the high demands of tough daily workshop use, the sleeve is characterised by extremely robust material quality and precise manufacturing. It permanently withstands continuous mechanical loads as well as the high clamping pressures of pneumatic systems. The result is a low-wear, durable investment that sustainably safeguards process quality in operation.
